

Rows share a y-axis across ontologies so cross-ontology magnitudes are comparable. Coverage is the fraction of the 754 test proteins receiving any non-zero score; a method with high F_{max} but low coverage annotates few proteins confidently rather than annotating all of them well. Excluded methods: BLAST (top-10), BLAST (max ident.). Generated by `src/plot_benchmark.py` from `results/benchmark_metrics.csv`.
