

Shared y-axis across panels; all three show the same metric on one scale. The mean and s.d. are drawn only while all five seeds are still training — seeds early-stop at different epochs (e.g. CC at 18/20/20/23/28), so the shaded tail is a shrinking subset and its apparent drop is an averaging artifact, not instability. Generated by `src/plot_arc_tuning.py` from `arc_tuning_cafa/five_seed_hybrid/*/seed_*/history.csv`.
