

Rows are input modality, columns are ontology. Boxes show the median and interquartile range across $n = 5$ training seeds and whiskers the full range; because five points is a thin basis for quartiles, every seed is plotted on top and the points are the evidence. † marks the MLP structure-only constant-predictor control. AUROC/AUPRC rank the models differently from F_{max}/F_{min} ; see the paired metric-family figure. Macro-AUPRC values are provisional: archived tables were produced with a trapezoidal PR estimator that is upward-biased for tied scores (see docs/figure_data_integrity.md); regenerate before reporting. Generated by `src/plot_arc_ablations.py` from `ablations/**/test_metrics.json`.
